Introduction
Welcome to The Dudley Group NHS Foundation Trust. This leaflet will provide you and your relatives with information about a stellate ganglion block. It includes information on what stellate ganglion blocks are, the risks and benefits of them and what the procedure involves.

What is a stellate ganglion block?
It is an injection into a group of nerves located in the neck and can be used to improve the pain caused by irritated or inflamed nerves in your head, face, neck, arms or even your chest.

The injection consists of both local anaesthetic and steroid which both act towards blocking the pain signals sent to the brain. The steroid also reduces swelling and inflammation which may be irritating the nerves and causing some of the pain you are experiencing.
What are the benefits?
The local anaesthetic numbs the nerves in the short term. The steroid reduces inflammation which can often provide long term pain relief.

Initially for the first few days, you may experience a worsening of your pain but after this you should notice the pain relief. The injection can relieve the pain for a few weeks or months but everyone experiences the effects in a different way.

Steroids have been used for decades for their beneficial effects. Although steroids are not licensed for this specific procedure their use is endorsed by the British Pain Society. The steroids we use act locally and so minimise any side effects.

What are the risks?
Overall, steroid injections are very safe and serious side effects or complications are rare. However, like all injection procedures there are some risks:

Common risks
The following may happen but should only last a few days:

- Warm, tingling feelings or numbness in the area treated.
- Headache.
- Face may be red.
- Blocked nose.
- Droopy eyelids.
- Red eyes and your sight may be slightly blurred, meaning you have difficulty reading.
- Numbness in throat, difficulty in swallowing or a hoarse voice.
- Difficulty in breathing.
- Drop in blood pressure which may cause you to feel lightheaded.
- You may develop temporary weakness in your arms.
• Bruise at the site of injection.
• An increase in your pain – this should only last a few days.

Rare risks
• Infection.
• Anaphylaxis – severe allergic reaction to drugs.
• Damage to surrounding area such as blood vessels, thyroid gland, oesophagus (food pipe).
• Nerve injury either temporary or permanent.
• Collapsed lung.
• Convulsions.
• Stroke.
• Cardiac arrest.

If you experience any of these rare risks, please contact the Pain Management Helpline on 01384 244735, your GP or in an emergency dial 999.

Steroid-related issues
Compared to regular steroid use, the steroid injection used for pain procedures is associated with minimal side effects, however:

• If you have diabetes, you may experience a slight rise in blood sugar for up to two weeks so you should monitor your blood sugar very carefully. Contact your GP or diabetic nurse if you have any problems.

• If you have heart failure, you may experience increased shortness of breath due to salt and water retention. Contact your GP or nurse if you have any problem).
X-ray precautions:
- The procedure uses X-rays and these use a small amount of radiation which may add slightly to the normal risk of cancer.

Female patients – you must tell us if you are or might be pregnant. If you are not sure, a pregnancy test will be offered.

What are the alternatives?
You do not have to have a stellate ganglion block injection and your consultant will discuss alternative treatments with you appropriate to your condition. If you prefer, you can continue to take painkilling medication without having any other treatment.

How do I need to prepare for the procedure?
- You should not eat for six hours before the procedure but you can drink clear fluids up until two hours before procedure. Clear fluids include water and diluted squash but not fruit juice, tea, coffee or milk.
  
  The exception to this information is if you have diabetes. If so, discuss with your doctor what you should do about your diabetes medication.

- Your treatment will be at Russells Hall Hospital or Corbett Outpatient Centre as an outpatient in the Day Surgery Unit (either a morning or an afternoon appointment). This will be confirmed at your clinic appointment.

- You will be at hospital for between two to four hours.

- You will need to arrange for someone to drive you home afterwards.

- Please arrange to have someone with you overnight.
• Please note that if you have sedation during the procedure:
  o You should not drive or operate machinery for 24 hours afterwards.
  o You may not be able to co-operate during the procedure.
  o You may not remember information given to you afterwards by your doctor. Your memory may be affected for up to 24 hours after the procedure.
  o The effect of the sedation may be prolonged by other drugs you are taking.

What do I do about medication?
• You should take all your regular medications **except blood thinning medication** such as clopidogrel, warfarin, dipyridamole, rivaroxaban. We will give you instructions about what to do about these drugs when you are given your appointment for the injection.

• Please **bring a repeat prescription document with you** if you are taking any regular medications.

What does the procedure involve?

Before the procedure
• A doctor will discuss the procedure with you and ask you to sign a consent form.

During the procedure (duration 10 to 15 minutes)
• This is carried out in theatre while you are awake.

• You may be offered sedation through an injection into the back of your hand to help you to relax.

• You will sit upright and your neck will be cleaned with an antiseptic solution which may feel cold. Sterile sheets will then be placed around the area for injection. A local anaesthetic will be injected into your neck to numb the area.
• An X-ray will be used to ensure proper positioning and we may also use an ultrasound for guidance.

• The site will be injected with local anaesthetic and a steroid. You may feel some pressure and pushing whilst this procedure is being carried out but you should have no pain. If you do feel any discomfort, please tell a member of the theatre team.

• Once completed, a plaster will be placed over the injection site. You will then be taken to the recovery area.

After the procedure
• In the recovery area, we will observe you for 30 minutes as you might feel little a drowsy and sleepy.

• You will also be offered light refreshments and after this you can go home.

What do I need to do when I go home?
When you get home, please continue to take any regular medication. It may be necessary for you to take painkillers for a day or two. You might need someone at home to help you but you do not have to stay in bed. The plaster can be removed the next day.

You should gradually increase your level of activity. However, do not take up new exercises until your muscles have had time to adapt. Build up by your exercise levels by increasing your physical activity (e.g. walking, swimming, housework) gradually every few days. The eventual aim is to get back to a level of activity that is normal for you.
